## Introduction

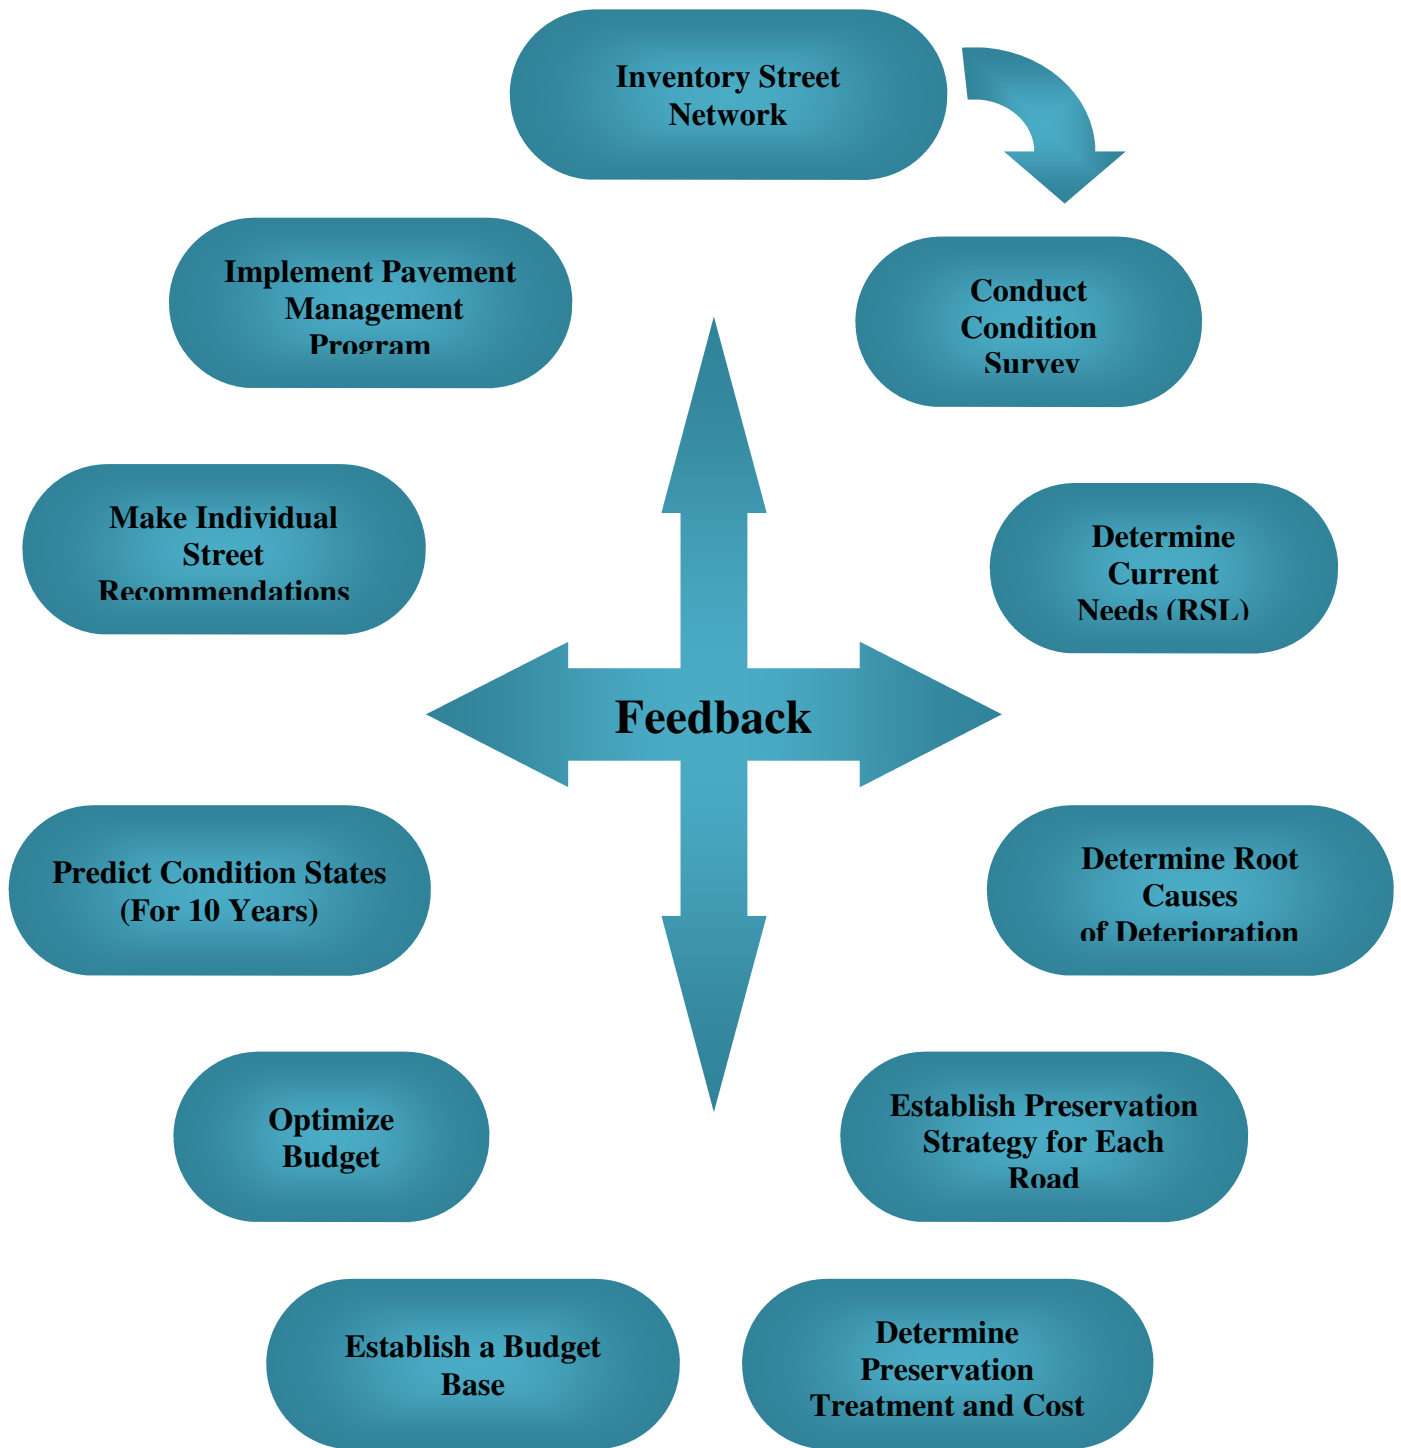

One of Bountiful City's most valuable infrastructure assets is the approximately 158 miles of local streets within its network. Maintaining the street network at a high level of service will promote the prosperity of Bountiful's entire community. Many state and local transportation agencies currently use a pavement management system and/or a maintenance management system to cost effectively preserve and improve their street network. The Utah Local Technical Assistance Program (LTAP) assists local agencies in the state of Utah and surrounding states to implement and use pavement management software to maintain, preserve, and enhance their road and street assets and more effectively manage the allocation of funding as it pertains to the existing street network.

The City of Bountiful contacted the Utah Local Technical Assistance Program (LTAP) on February, 21 2017 requesting a survey of Bountiful's road network. A proposal was written up by Utah LTAP and sent to Bountiful City Public Works on March 3, 2017.

The City of Bountiful asked the Utah LTAP to develop a pavement management system that could be used in their transportation plan. This report describes the system's major elements, the processes, and the work accomplished to facilitate its implementation in Bountiful. The pavement management system provides:

- A complete GIS-based physical inventory and condition survey of the street network
- A needs assessment process
- Analyses of root causes of pavement deterioration
- Analysis of current street maintenance programs
- Recommended maintenance and preservation treatments
- Treatment costs and budget proposals
- A method to evaluate alternate funding scenarios to maximize the average remaining service life (RSL) of the street network

Figure 1 outlines the major elements and processes incorporated in Bountiful's Pavement Management System. The following sections of this report describe each step of the process in detail, the results of field surveys and analyses, and the conclusions and recommendations offered to assist in the full implementation of the system in Bountiful.

**Figure 1. Pavement Management Process Diagram**

## **Inventory of Road Network**

The first step in the process of inventorying Bountiful's local street network involved assigning a functional classification to each street. City officials assisted in making these classifications. Excluding the state routes, the inventory identified four functional classifications: residential, major and minor collector, and minor arterial.

The second step in the inventory process involved a GIS map with shape files of the road network previously developed by Bountiful City. In addition to using the existing centerline shape file for the street network a measuring wheel was used to measure the street widths. Data from the GPS mapping process was used to calculate the lengths of all street segments. Measured widths and lengths were used to calculate the street surface areas.

A complete condition survey of Bountiful's local road network was conducted during July of 2017. Employees from the Utah LTAP (Local Technical Assistance Program) Center used the Strategic Highway Research Program (SHRP) Distress Manual as a guide to conduct the pavement distress survey

Bountiful City Public Works continued with their road maintenance and construction projects as the employees of Utah LTAP performed the survey and analyzed the condition of the road network. These construction projects did not interfere with survey techniques or influence the results of the analysis.

Appendix A contains the complete results of the inventory processes. Inventory details include street name, starting and ending addresses of the segment, functional classification, segment width and length, estimated remaining service life (RSL), surface area of the pavement in square yards, and the percent of network area represented by each segment. Table 1 contains a sample of the inventory of roads as found in Appendix A.

**Table 1. Excerpt Showing Details in the Inventory Process of the Local Street Network**

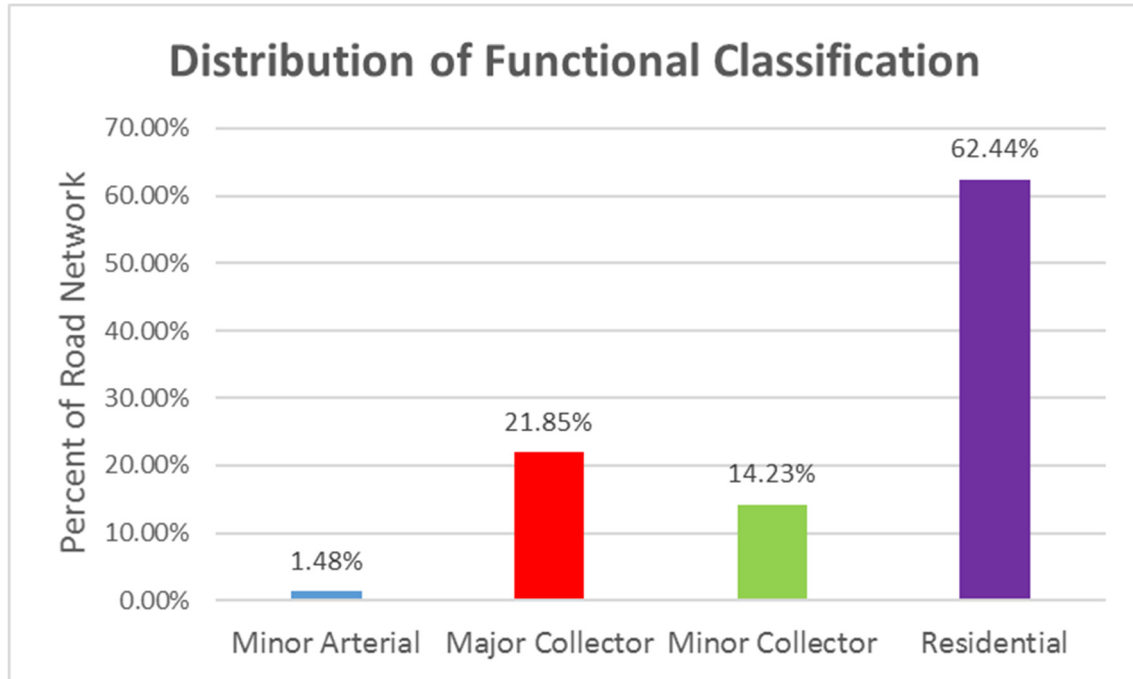

ID	Street Name	From	To	Class	Width (ft)	Length (ft)	RSL	%Area	Area (sq yd)
1839	200 W	Pages Ln	City Boundary	Minor Arterial	40	999	10	0.15%	4440.00
1814	1500 S	Main St	500 W	Major Collector	50	1749	6	0.32%	9716.67
1559	Orchard Dr	100 W	200 W	Major Collector	55	871	20	0.17%	5322.78
189	400 E	Oakridge Dr	Bountiful Blvd	Minor Collector	30	1916	10	0.21%	6386.67
683	Moss Hill Dr	Brentwood Ln	300 S	Minor Collector	30	218	12	0.02%	726.67
390	200 E	2450 S	2200 S	Residential	30	946	14	0.10%	3153.33
1328	Emerald Hills Dr	1500 S	Emerald Hills Cir	Residential	30	1136	4	0.12%	3786.67

Table 2 provides a summary of the street inventory information with respect to each functional class in terms of surface area and the percent of the street network represented by each functional class.

**Table 2. Functional Classification by Surface Area and Percent of Local Street Network**

	Minor Arterial	Major Collector	Minor Collector	Residential
Area (yd <sup>2</sup> )	45,125	668,333	435,062	1,909,696
Percent of Road Network	1.48%	21.85%	14.23%	62.44%

Figure 2 illustrates the information from Table 2 in graphical form.

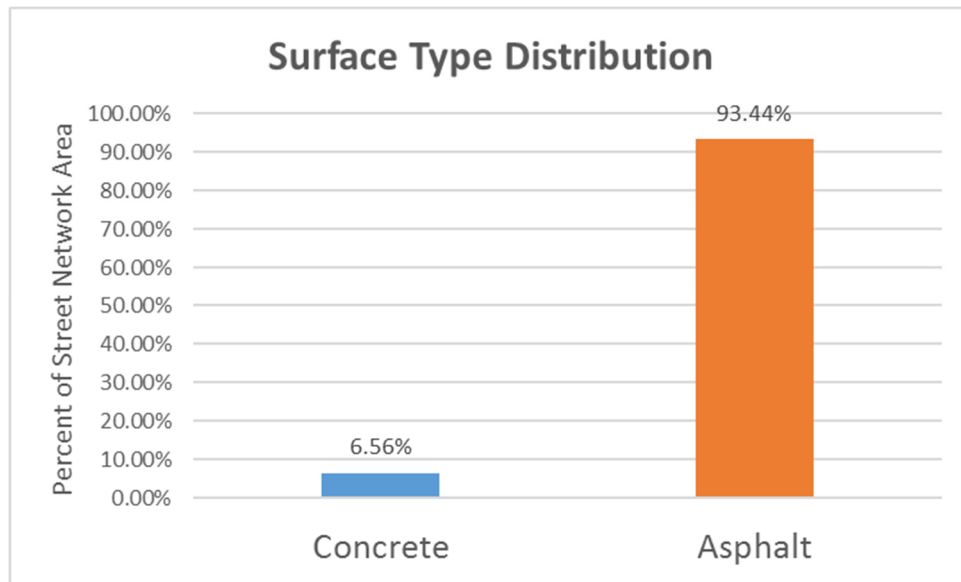

**Figure 2. Distribution of Street Network by Functional Classification**

This inventory excludes pavement structure details regarding date of initial construction, layer thickness, and pavement design criteria of each street. This information can be obtained from historical records, maintenance personnel, or sampling and testing of the pavement structure. This information should be incorporated through further implementation efforts and by working closely with Bountiful City Public Works.

## Pavement Type Distribution of the Road Network

Currently a small percentage of Bountiful's street network (6.56% by surface area) is made up of concrete roads. The current percentages of asphalt and concrete roads by surface area are shown in Figure 3.

**Figure 3. Percentages of Asphalt and Concrete Streets by Surface Area**

Because such a small percentage of segments within Bountiful's jurisdiction is concrete and the majority of the concrete segments are in good condition, only a limited examination of the concrete segments will be provided.

## **Pavement Condition Survey**

### **Asphalt Road Network**

A complete condition survey covering pavement distress of Bountiful's road network was conducted during July of 2017. Employees from the Utah LTAP (Local Technical Assistance Program) Center used the Strategic Highway Research Program (SHRP) manual, Distress Identification Manual for the Long-Term Pavement Performance Project as a guide to conduct the pavement distress survey.

The principal focus of the asphalt condition survey was to identify and determine the severity level and extent of each distress type. Each asphalt street segment was closely surveyed for the presence of potholes/utility cuts, transverse cracking, longitudinal cracking, block cracking, edge cracking, and fatigue (alligator) cracking. The severity level and extent of each distress type were evaluated in accord with the condition survey evaluation sheet shown in Appendix B. Appendix C shows the detailed distress information for each road segment.

### **Concrete Road Network**

The principal focus of the concrete condition survey was to identify and determine the severity level and extent of each distress type. Each street segment was closely surveyed with respect to spalling of joints, joint seal damage, corner breaks, faulting, longitudinal cracks, transverse cracks, patching, and map cracking. The severity level and extent of each distress type was evaluated in accord with the condition survey evaluation shown in Appendix B. Appendix C shows the detailed distress information for each segment.

Concrete Pavement Restoration (CPR) is an important part of maintaining concrete pavement. The primary focus for concrete pavement should be making sure that any joints and all cracks are sealed properly. If joints and cracks are sealed correctly, moisture is not allowed to enter and destroy road base and cause further settling and slab damage. A concrete segment was given a good rating if there was slope to the cross section of the roadway and all joints were sealed properly. If there was no slope to the cross section and joints were starting to break, a fair rating was given. If the segment had no slope and joints and cracks were not sealed or broken, a poor rating was given.

## Asphalt Pavement Design & Performance

Typically, asphalt pavements, designed in accord with the AASHTO Guide for Design of Pavement Structures, ought to provide for twenty years of traffic loading (18 kip ESAL's) before reaching a terminal serviceability level at which point reconstruction is required (RSL = 0). For management purposes, the same estimate is used to calculate the service life of concrete pavements as well. Conventional practice usually provides for a preventative maintenance treatment and rehabilitative treatment to be applied to the asphalt or concrete pavement during its 20-year service life. Timing is critical in the placement of the preventative maintenance and the rehabilitative treatment to achieve the best level of service at the least amount of cost.

Figure 6 shows a typical pavement performance curve for asphalt pavements. This figure emphasizes the time relationship between street pavement condition and the cost of repair.

**Figure 4. Pavement Performance Curve**

After eight years of service (RSL = 12), most asphalt pavements will deteriorate to a "good" condition category. This relates to a thirty-three percent (33%) drop in the service life of the pavement and is the optimal point in time at which a preventative maintenance treatment should be placed. After twelve years of service (RSL = 8), most asphalt and concrete pavements will deteriorate to a "fair" condition rating. This represents a sixty percent (60%) drop in the service life of the pavement and is the best point in time at which to consider a rehabilitation treatment. If no renovation action occurs at this point, the street will likely deteriorate to the "poor" category within three years (RSL = 5). Cost comparisons show that reconstruction will cost two to three times more than rehabilitation strategies. The cost to maintain a pavement with preventative maintenance strategies relates to about one-fifth the cost of rehabilitation strategies, or one-tenth the cost of reconstruction.

The RSL of a road is not affected by the appearance of the road. A road may be rough on the surface or have some small bumps and cracks, but this does not necessarily mean that the road is in poor condition. The RSL is based on the structural integrity of the road. A responsible maintenance program will be built around maintenance strategies that improve the service life of the roadway, not simply applying treatments to improve the appearance or smoothness of the road.

## Major Causes of Asphalt Pavement Distress

The predominant asphalt pavement distresses affecting Bountiful's streets were determined from the pavement distress survey information. Analysis of this information showed that there were six major distress types prevalent in the street network. Pavement roughness results from these distresses. Fatigue cracking was the major distress type found occurring most frequently in the asphalt street network.

The root causes of each of the seven main distress types are described as follows, along with respective suggestions on how to mitigate the development of each:

Transverse cracking in asphalt pavements is normally attributed to thermal changes in the pavement structure. As seasonal temperatures change, the pavement expands and contracts beyond the limits that asphalt can tolerate, thus causing transverse cracking. If these transverse cracks are not sealed early in their development, they will continue to grow in terms of both severity and extent, and they will allow surface moisture to enter the pavement causing further distress to develop. Recent developments in asphalt technology known as the Superpave System have shown the potential to preclude the development of transverse cracking if used in new asphalt pavements. Use of performance graded (PG) asphalt cements and the Superpave mix design system, along with good quality control and good hot mix asphalt construction practice can potentially eliminate this type of distress from occurring. Using the Superpave System on newly constructed or reconstructed streets that serve a relatively high volume of traffic is recommended.

Longitudinal cracking is related to two different causes. The first is poor construction. When a street is constructed, it is normally built in two or more sections. Problems, such as poor compaction or segregation in the asphalt mix, will cause longitudinal cracks along the construction seam. The second cause of longitudinal cracks is load related. These longitudinal cracks are found in the wheel paths of the travel lanes. These cracks are due to early fatigue

failure and should be treated as fatigue cracks. On some street segments that are extremely wide, longitudinal cracking may be caused by thermal changes as with transverse cracks.

Block cracking is a combination of transverse and longitudinal cracking that occurs when the transverse and longitudinal cracks intersect. The combination of these two distresses allows greater opportunity for surface water to enter the pavement structure, thus decreasing the load carrying capacity of the pavement. Once a block forms, water enters and softens the base. As the base softens, normal traffic loading progressively breaks the pavement into smaller and smaller blocks. This leads to the development of fatigue cracking.

Utility cuts are man-made cuts and have been shown to reduce the service life of a street by as much as five to seven years. Although utility cuts are sometimes inevitable, good planning and coordination of utility work can reduce the number of utility cuts made in newer streets.

Only limited rutting of the pavement surface was observed in Bountiful's street network. This form of distress typically occurs in the wheel paths and is a result of deformation in the pavement structure or subgrade. This deformation comes from heavy axle loads acting in combination with moisture to deform and rut the pavement. Inadequate compaction during construction can also result in deformation. Rutting may also occur in hot weather when the asphalt is less viscous and has less shear strength. In this case, rutting usually results from the use of poor materials, poor asphalt mix design, poor quality control, or poor construction.

Edge cracking was generally found in street segments where pavement edges had little or no support. Those segments that had no paved shoulders or supporting curb and gutter sections were more prone to this type of distress.

Fatigue cracking is the main governing distress in the majority of the streets and affects sixty-nine percent (69%) of the network surface area. Fatigue cracking in asphalt pavements is largely caused by loss of base and subgrade support due to moisture infiltrating the pavement. Once moisture softens the base and subgrade layers, the asphalt pavement can no longer effectively carry the traffic loading. This results in pavement cracking and breakup. The fatigue cracking prevalent in the streets of Bountiful is most likely caused by water saturating the base and

subgrade layers. With the subgrade saturated, the road structure flexes and gives under the weight of a vehicle that drives over the street.

Heavy vehicle traffic on the streets also causes fatigue cracking, by applying greater stresses to the pavement than it is designed to support. In those areas of the city where new homes are being constructed concrete trucks or other heavy vehicles can cause major damage to the streets.

Heavy commercial trucks fall within the heavy vehicle traffic designation.

## **Pavement Distress Survey & Analysis**

The first step in the analysis of the pavement distress survey information involves determining the governing distress type for each street segment. A governing distress is one that is most detrimental to the condition of the pavement, and so should be the focus of treatment. Each rating for each distress is associated with an RSL value; a higher distress rating results in a lower RSL rating. To analyze a segment, find the lowest RSL value associated with any of the distresses assigned to the segment. This value becomes the RSL for the entire segment and the corresponding distress is the governing distress.

Figure 5 shows an example rating sheet for a road segment and Table 3 shows the RSL values associated with fatigue cracking ratings. The distress rating of 5 for fatigue cracking corresponds with an RSL of 6. Similar tables would be used for the other distresses reported on the segment. An analysis of the distresses shown below shows that fatigue cracking is the governing distress because it gives the lowest RSL value (besides being the highest numerical rating).

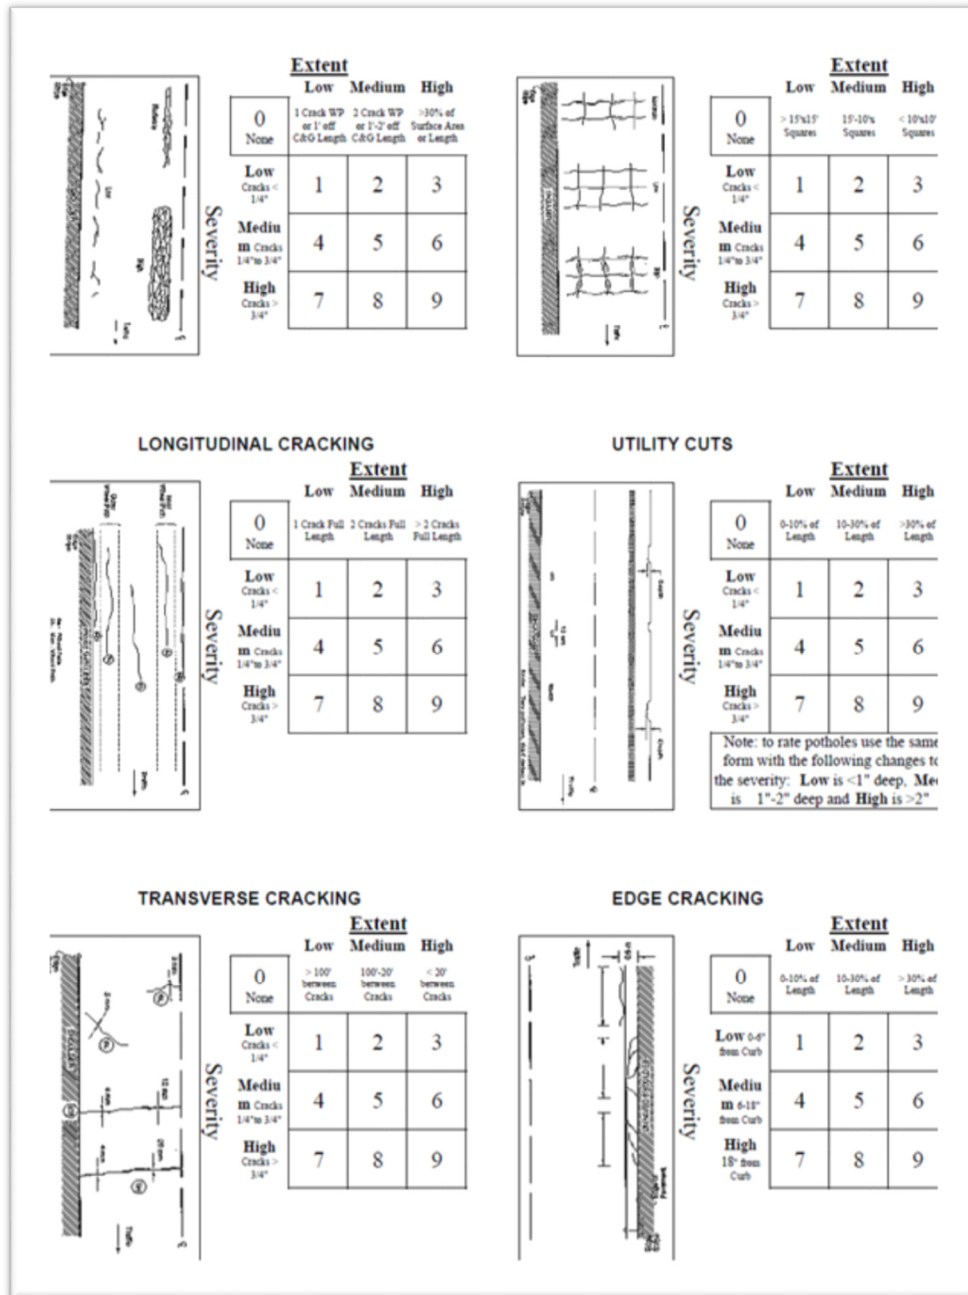

Figure 5. Condition Rating Sheet

**Table 3. Fatigue Cracking Distress Table**

<b>RATING</b>	<b>SEVERITY &amp; EXTENT</b>	<b>RSL</b>
0	No Alligator Cracking	20
1	Low, Low	10
2	Low, Medium	8
3	Low, High	6
4	Medium, Low	8
5	Medium, Medium	6
6	Medium, High	4
7	High, Low	6
8	High, Medium	2
9	High, High	0

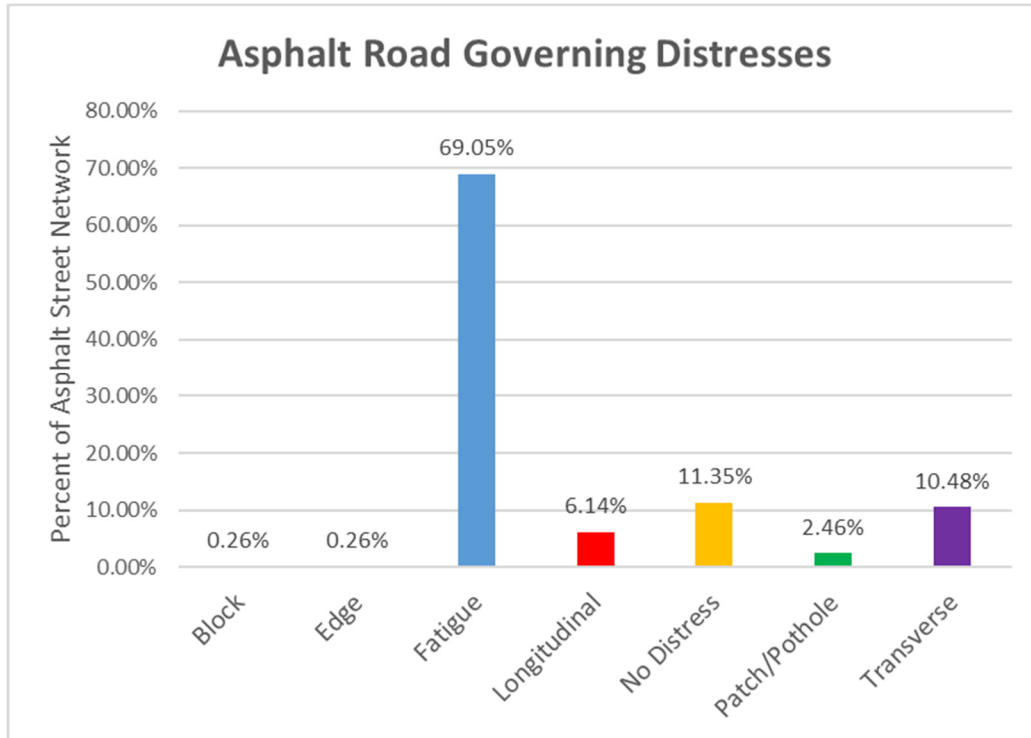

The governing distress is the distress most likely to cause the pavement to deteriorate the soonest and reduce the serviceability of the street. Appendix D contains the deterioration tables for the other distress types. These tables can be adjusted by experienced personnel to more accurately reflect the effects of local environmental and traffic loading conditions.

Table 4 includes several recommended preservation strategies and treatments, the estimated cost of each treatment, and the estimated remaining service life the road is expected to gain after the treatment is applied.

**Table 4. Maintenance Performance Table**

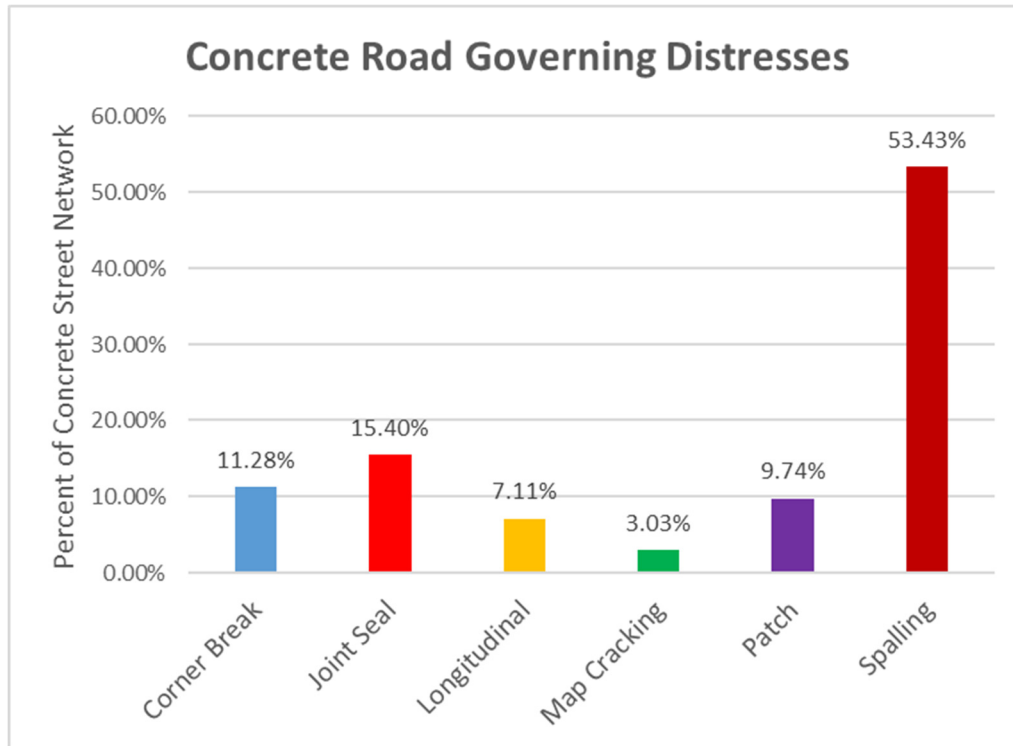

Treatment Type	Maint. Category	Cost	0	1-3	4-6	7-9	10-12	13-15	16-18	19-21

Base/Pavement Replacement (3/3/6 in.)	Reconstruction	\$28.50	20	20	20	20	20	20	20	20
*Fit the current RSL into a category along the top row and then move downward to the applied treatment to find the additional RSL that will be achieved from the selected treatment.										
(2/2 in.) Means 2" overlay with 2" recycle			(3/3/6) Means 3" HMA over 3" Road Base over 6" Base							

The previous procedure was used to determine the governing distress and the RSL for each asphalt segment. Figure 6 shows the governing distress types in the asphalt street network along with the percent of the total asphalt street network area affected by each type.

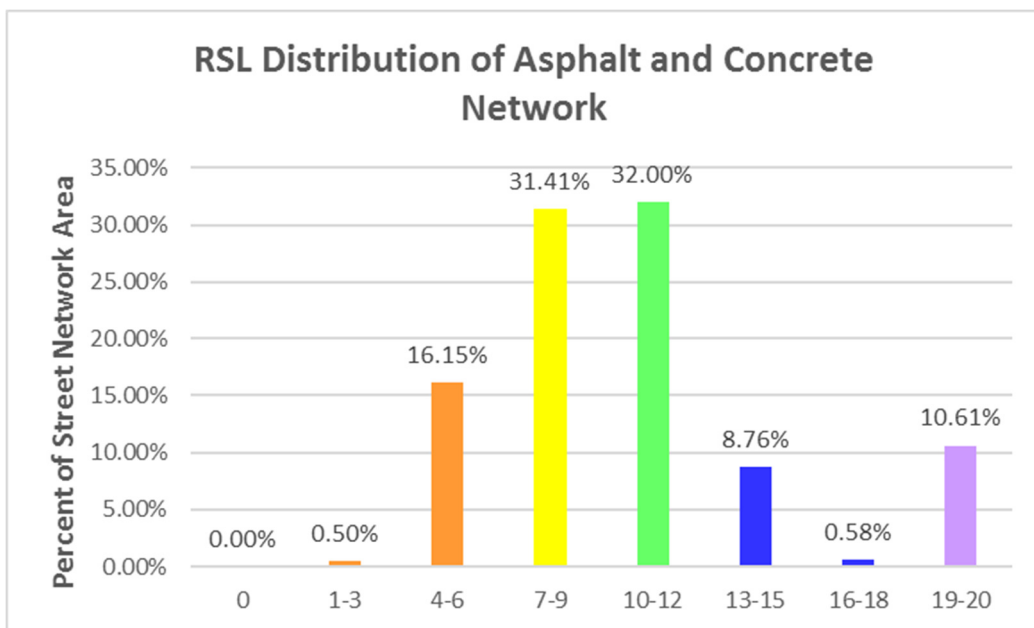

**Figure 6. Governing Distress Rating Distribution for Asphalt Roads**

As a reference, one percent (1%) of Bountiful's asphalt street network represents approximately 1.5 miles in length. Figure 6 also illustrates that some governing distress types are more common to the street network. Fatigue is the most common governing distress types in Bountiful's asphalt street network. Within the concrete street network, spalling of joints was the predominant governing distress. Figure 7 shows the governing distress types in the concrete street network along with the percent of the total concrete street network area affected by each type.

**Figure 7. Governing Distress Rating Distribution for Concrete Roads**

The governing distress type of each segment provided the means of calculating the average RSL for the street network. For management purposes, the estimated RSL values are grouped incrementally in three-year categories. Figure 8 shows the current RSL distribution for Bountiful's street network in terms of percent of surface area of the network.

**Figure 8. Current RSL Distribution for Asphalt and Concrete Street Network**

The estimated average RSL of Bountiful’s street network is 10.26 years. The average RSL value for Bountiful is slightly below the average RSL value of 10.89 years for all Utah cities surveyed since 2002 by the Utah LTAP Center. Table 5 shows this same information along with the corresponding subjective condition ratings of poor, fair, good, very good, and excellent.

**Table 5. Subjective Condition Rating of Asphalt and Concrete Street Network**

SUBJECTIVE CONDITION RATING OF STREET NETWORK								
	FAILED	POOR		FAIR	GOOD	VERY GOOD		EXCELLENT
RSL (Years)	0	1-3	4-6	7-9	10-12	13-15	16-18	19-20
% of Network	0.00%	0.50%	16.15%	31.41%	32.00%	8.76%	0.58%	10.61%

Zero percent (0%) of the paved street network in Bountiful is considered to be in a failed condition. Seventeen percent (16.65%) is considered to be in poor condition. Thirty-one percent (31.4%) is rated to be in fair condition, thirty-two percent (32%) is in good condition, nine percent (9.3%) is in very good condition, and eleven percent (10.6%) of the street network is rated to be in excellent condition.

Table 6 shows a list of cities within a radius of 50 miles from Bountiful that Utah LTAP surveyed over the past 10 years. This table shows that these cities have a similar average RSL value to Bountiful. The average RSL value of 10.64 years for all of these other cities is slightly above Bountiful's average RSL value of 10.26 years. Compared to the rest of this cities on the list, Bountiful has the lowest percentage of roads at the terminal serviceability level (RSL=0) at zero percent (0%).

**Table 6. Multi-City Comparison of Street Network Condition Ratings**

City/Year	0	1-3	4-6	7-9	10-12	13-15	16-18	19-20	Average RSL
<b>Bountiful 2017</b>	0.0%	0.5%	16.2%	31.4%	32.0%	8.8%	0.6%	10.6%	10.26

<b>North Salt Lake 2007</b>	2.2%	5.8%	20.8%	13.7%	43.9%	4.9%	8.3%	1.1%	9.7
<b>Tooele 2015</b>	1.3%	0.2%	14.4%	14.6%	35.0%	4.3%	18.7%	11.6%	11.7

For further illustrative purposes, the following photographs show examples of the condition ratings of poor, fair, good, very good, and excellent and their respective RSL estimates.

**Photo 1. Poor Condition – Emerald Hills Dr from Emerald Hills Cir to Davis Blvd (RSL = 4 years)**

**Photo 2. Fair Condition – 1200 E from 500 N to 700 N (RSL = 8 years)**

**Photo 3. Good Condition – 200 W from 1700 S to 1500 S (RSL = 10 years)**

**Photo 4. Very Good Condition – 250 W from Monarch Dr to City Boundary (RSL = 14 years)**

**Photo 5. Excellent Condition – 200 E from 550 N to 400 N (RSL = 20 years)**

Currently, Bountiful's paved street network is in "good" condition. Zero percent (0.0%) of the network is at a terminal serviceability level as shown in Table 5. If no preservation or rehabilitation work is undertaken, 5.70% can be expected to deteriorate to a terminal serviceability level in three years.

On average, each street segment will most likely lose one year of service life per year without some preservation work being done. Within three years, if no pavement preservation is performed, about 41.9% of the asphalt and concrete paved network will probably deteriorate to a poor condition. This could place a major financial burden on the city to reconstruct these segments to provide adequate roads, as well as reduce the amount of public satisfaction with the street network. If a systematic pavement management program is continued now, a balanced set of preservation strategies (e.g., routine maintenance, preventative maintenance, rehabilitation, and reconstruction) can be used to preclude the development of a backlog of needs and the overall decline in the service life of the network.

## Concrete Road Network

Analysis of the condition survey information showed that there were six major distress types prevalent in the street network. The percent of the street network area affected by these distress types was previously shown in Figure 7.

The root causes of each of the nine main distress types are described as follows, along with respective suggestions on how to mitigate the development of each:

Spalling of Joints is the primary governing distress in the concrete street network; affecting fifty-three percent (53.4%) of the area. Spalling of joints is typically found in pavements that are either much older, when design practices were less efficient and effective; they also occur when existing expansion and contraction joints are not properly maintained. In the past, the practice with concrete pavements was to use various spacing combinations of expansion and contraction joints in an attempt to relieve compressive stresses in the pavement and prevent blow-ups. Expansion joints have been shown to progressively close over the years and the result is spalling at the joints. The same problem arises with improper maintenance or cleaning of the joints, whether or not they were engineered correctly. When a joint is allowed to fill up with debris, the stress that is not relieved by the joint is transfer through the material, causing spalling. To mitigate the problem, joint resealing should be used in conjunction with techniques such as patching or surface grinding, becoming a necessary part of concrete pavement restoration (CPR). It is usually the last step and is done to protect the newly rehabilitated pavement from excessive moisture.

Joint seal damage is most commonly caused by age and traffic wear. Obviously the materials used in joints are much less rigid and durable than the concrete and are prone to comparatively rapid deterioration. As joint seal deteriorates, moisture and debris are allowed to penetrate the joints and into the subgrade. This can lead to other types of distress. Conversely, it is impractical and unsafe to maintain an impervious pavement. Proper inspection of the joint condition should be done, primarily before hot weather and/or freeze-thaw cycles begin. As was

previously stated, the joint resealing should be done in conjunction with other rehabilitative techniques.

Corner breaks are primarily caused by erosion of the subgrade material caused by pumping or high corner consolidations. The root cause of this is often moisture entering the subgrade as larger volumes of traffic applies weight to the concrete slab; subgrade material is “pumped” out and a void is created under the slab. To help alleviate this problem, inspection of the slabs is also important in identifying the signs of pumping and faulting at one or more edges. Measures should be taken to fill the voids under slabs.

Broken slabs are a result of the natural stress cracking of concrete occurring at undesired locations. Cracking might result from too many fines in the aggregate or untreated distress. When broken slabs occur replacing the entire slab is more cost effective than attempting to repair the damage to the slab.

Faulting is the vertical dislocation of slabs from one another at a joint or crack. Faulting is typically caused by moisture seeping into and eroding the subgrade. Heavy loading or high traffic volumes in combination with poor compaction of the subgrade also lead to faulting. In its early stages, faulting can be rectified through grinding. As the severity of faulting increases, more aggressive approaches must be taken to repair the slab. The extent of the faulting should also be taken into consideration as it may be more cost effective to replace the slab altogether.

Longitudinal cracking is related to two primary causes. The first is poor construction. When a street is constructed, it is normally built in multiple sections. Poor compaction, segregation in the aggregate mix or seasonal expansion/contraction of the surrounding soil will cause longitudinal cracks along the center of the slab. The second cause of longitudinal cracks is loading. Longitudinal cracks are found in the wheel paths of travel lanes. Cracks in the wheel path are due to early fatigue failure and should be treated as fatigue cracks. On some street

segments that are extremely wide, longitudinal cracking is likely to be caused by thermal changes as with transverse cracks.

Transverse cracking is common in concrete pavements. Transverse cracking is normally attributed to thermal change in the pavement structure. As seasonal temperatures change, the pavement expands and contracts beyond the limits that concrete can tolerate, thus causing transverse cracking. If transverse cracks are not sealed early in their development, they will continue to grow in terms of both severity and extent. Continued neglect will allow surface moisture to enter the pavement and cause further distress.

Patch deterioration is almost always caused by improper installment of a patch. Patch deterioration commonly results from laying the patch material too thin or in too extreme of temperature conditions. If laid correctly, the patch prevents moisture seepage.

Map cracking (also referred to as alligator cracking) is intersecting cracks which extend below the surface of hardened concrete. Map cracking is sometimes caused by differential shrinkage of drying surface concrete in relation to concrete at greater depths where little or no shrinkage occurs. Other causes of map cracking include overworking the surface during finishing and a problem with the quality of the aggregate known as ASR (alkali-silica reactivity). The cracks vary in width from fine and barely visible to open and well-defined. If severe, cracks may spall or the surface may scale. Repair is usually limited to very severe conditions. An asphalt overlay or partial depth patching may then be necessary.

## Development of Preservation Strategies and Recommended Treatments

After determining the governing distress types for each street segment, pavement preservation strategies and treatments that can effectively correct or remove the root causes were identified. Frequently, more than one strategy or treatment can be used to cost effectively remedy the governing distress and other accompanying distresses that may exist. As an example, the distress deterioration table for fatigue cracking is shown in Table 7. This table shows the various combinations of severity and extent (rating) levels that may occur, along with their preservation strategies and recommended treatments. The corresponding estimated RSL of each rating level is also shown.

**Table 7. Fatigue Cracking Preservation Strategies and Treatments**

RATING	SEVERITY & EXTENT	RSL	STRATEGY	TREATMENT
0	No Alligator Cracking	20	No Maintenance	No Maintenance
1	Low, Low	10	Routine	Slurry Seal
2	Low, Medium	8	Rehabilitation	Thin Hot Mix Overlay (<2 in)
3	Low, High	6	Rehabilitation	Thin Hot Mix Overlay (<2 in)
4	Medium, Low	8	Rehabilitation	Thin Hot Mix Overlay (<2 in)
5	Medium, Medium	6	Reconstruct	Thick Overlay (3 in)
6	Medium, High	4	Reconstruct	Rotomill & Thick Overlay
7	High, Low	6	Reconstruct	Thick Overlay (3 in)
8	High, Medium	2	Reconstruct	Cold Recycle & Overlay (3 in)
9	High, High	0	Reconstruct	Full Depth Reclamation (3/3 in.)

Distress deterioration tables with their preservation strategies and recommended treatments similar to this were developed for each distress type and are given in Appendix D.

The preservation strategies and recommended treatments given in Appendix F are grouped in the general preservation strategies of routine maintenance, preventative maintenance, rehabilitation, and reconstruction. Each major preservation strategy represents a particular level of work effort and a specific goal with regard to preserving or restoring the pavement.

Routine maintenance is primarily proactive and includes the work items of crack sealing, fog sealing, dig-outs, and patching.

Preventative maintenance is designed to slow pavement deterioration, as well as preserve and improve the functional condition of the pavement. Preventative maintenance strategies do not substantially increase structural capacity. Treatments in the category of preventative maintenance include sand seals, fog seals, chip seals, scrub seals, cape seals, slurry seals, and microsurfacing.

Rehabilitation serves to correct or remove root causes of distress and to add structural capacity and service life to the pavement. Rehabilitation treatments include thin hot mix asphalt overlays, hot surface recycling, bonded wearing courses, and combinations of leveling courses or rotomilling with overlays.

Reconstruction covers all types of work involved in totally reconstructing or replacing the pavement structure, thus providing a completely new pavement.

A detailed listing of all preservation strategies and their associated treatments with unit costs are given in Appendix F. The unit costs, separately provided by Road Science, L.L.C. and Bountiful, are based on the average costs per square yard. A special inventory form built within the Transportation Asset Management System (TAMS) computer program facilitates the analysis process and allows engineering judgment to be exercised at any point. An example of this form is shown in Figure 9. The program uses the previously entered distress information to determine appropriate treatments. For the segment shown in Figure 9, the recommended treatment is a Thick Overlay (3 in.).

**Figure 9. TAMS Inventory Form**

On the left side of the form, inventory information pertaining to the street segment is shown. This information includes the address and location of the segment, surface type, number of lanes, length, width, area, posted speed limit, and date inventoried. On the right side, the various distress ratings are listed, along with a recommended preservation treatment. The program provides valuable insight into the distresses affecting street segments and the corresponding pavement condition.

Appendix E shows the initial recommended pavement preservation strategies to be used on each street segment. Table 8 gives an example of the information contained in Appendix E. This information is sorted by treatment type and street name.

## **Assessment of Current Street Maintenance Program Funding**

### **Asphalt Road Network**

Maintaining and preserving Bountiful's street network at a high service level is vital to the well-being of the community. It is helpful for elected official to understand that the cost of construction and pavement preservation has increased significantly in the last ten years. Since cities have had little increase in the B & C gas tax fund, they can preserve only a fraction of the roads that they could in the past with the same money. This is putting road departments in the position of not being able to stay up with cost effective pavement preservation in the early years of a pavement's life. The only solution is to find other sources of funds or let some of the lower functional class roads go, hoping that low volume roads will last a little longer than the higher volume arterials and collectors. Segments in Appendix G were selected and prioritized based on of their level of functional importance to the road network so that the higher functionally classified roads could be done first.

Systematic and balanced pavement preservation programs providing for routine and preventative maintenance, rehabilitation, and reconstruction, will enable Bountiful to cost effectively maintain the street network. A pavement preservation program recommended for cities and towns is one that maintains an estimated average RSL of 10 years with no more than three percent (3%) of the street network at the terminal serviceability level (i.e. RSL = 0). Bountiful's 2017 RSL distribution is shown in Figure 10.

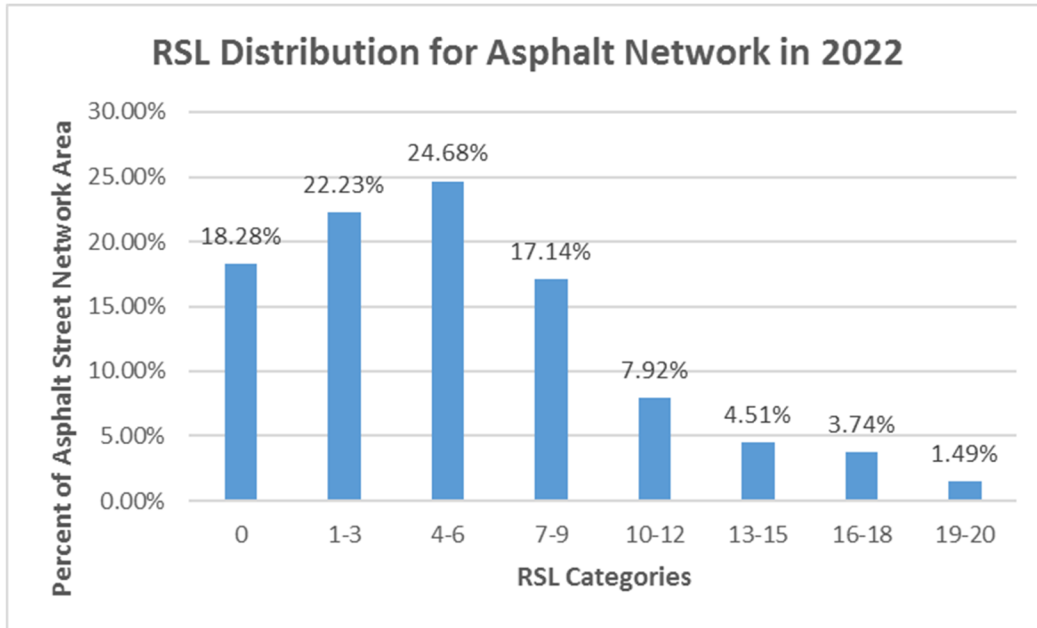

**Figure 10. Current RSL Distribution for Asphalt Street Network**

The average RSL for Bountiful’s asphalt street network for 2017 is estimated at 10.10 years with zero percent (0.0%) of the road network at a terminal service level. The current condition of Bountiful’s asphalt street network meets the given recommended standards by having an estimated average RSL value above 10 years with less than three percent of the street network at the terminal serviceability level. This illustrates that Bountiful has been maintaining its road network at a satisfactory level.

Figure 11 and Figure 12 illustrate the estimated RSL distribution for 2022 and 2027 if no maintenance is performed on the street network. The number of streets at a terminal service level (RSL = 0) would increase from 0.0 % to 54.9% by 2027.

**Figure 11. Estimated RSL Distribution for 2022 with No Maintenance**

**Figure 121. Estimated RSL Distribution for Year 2027 with No Maintenance**

The resulting estimated average RSL for the year 2022 is 5.49 years, and for the year 2027 is 2.52 years.

Figure 13 illustrates the estimated RSL distribution for 2022 for the current funding allocation of \$1,700,000 per year on average.

**Figure 13. Estimated RSL Distribution for Year 2022 Continuing with Existing Allocation**

The estimated number of streets at a terminal service level (RSL = 0) will increase from 0.0% to 2.85% by 2022. The resulting estimated average RSL for the year 2022 is 11.52 years which is an increase from 10.1 years in 2017. These resulting values meet the recommended standard of less than three percent (3%) of streets at the terminal service level and an average RSL of above 10 years. The overall RSL distribution of the road network has also improved.

## Development of Recommended Pavement Preservation Program

### Asphalt Road Network

A five-year pavement preservation program is recommended to increase the level of service of Bountiul's road network. This approach is estimated to increase the average RSL of the road network from 10.1 to 11.52 years over the five-year program. The first three years of the program focuses on preservation treatments on the arterial and collector roads and the last two years put more focus on maintaining residential roads. The focus of the treatment plan is preventative maintenance strategies such as crack seal and slurry seal to help preserve the life of the road network with the most cost effective methods. This will result in lower future maintenance costs for these roads thus leaving additional funding to be used in rehabilitation and reconstruction methods on the roads needing those treatments.

A five-year plan was chosen as opposed to a ten-year plan because of the high degree of uncertainty in predicting what will occur over such a long period of time. After 3 or 4 years, a new condition survey should be performed to see how the roads have deteriorated throughout the plan to produce an updated five-year treatment plan.

The first year of the program, 2018, focuses on minor arterial, major collector roads, and minor collector roads. The main treatments suggested for this part of the program are crack sealing, slurry sealing, patch work, rotomilling with a 2 inch overlay, and base repair and overlay. The estimated cost of road maintenance work for 2018 is \$1,416,297. The recommended funding distribution for the three pavement preservation strategies is given in Table 9.

Treatment Category	Funding
Routine/Preventative	\$ 866,561.56
Rehabilitation	\$ 257,907.80
Reconstruction	\$ 291,828.00
<b>TOTAL</b>	<b>\$ 1,416,297.36</b>

**Table 9. Paved Road Funding Distribution for 2018**

The second year of the program, 2019, focuses on major and minor collector roads. The main treatments suggested for this part of the program are crack sealing, slurry sealing, patch work, rotomilling with a 3 inch overlay, base repair and overlay, and full depth reclamation. The estimated cost of road maintenance work for 2019 is \$1,649,791. The recommended funding distribution for the three pavement preservation strategies is given in Table 10.

Treatment Category	Funding
Routine/Preventative	\$ 246,530.34
Rehabilitation	\$ 41,454.00
Reconstruction	\$ 1,361,806.34
<b>TOTAL</b>	<b>\$ 1,649,790.68</b>

**Table 10. Paved Road Funding Distribution for 2019**

The third year of the program, 2020, focuses on minor collector and residential roads. The main treatments suggested for this part of the program are rotomilling with a 2 or 3 inch overlay. The estimated cost of road maintenance work for 2020 is \$1,752,091. The recommended funding distribution for the three pavement preservation strategies is given in Table 11.

Treatment Category	Funding
Routine/Preventative	\$ -
Rehabilitation	\$ 783,361.50
Reconstruction	\$ 968,729.67
<b>TOTAL</b>	<b>\$ 1,752,091.17</b>

**Table 11. Paved Road Funding Distribution for 2020**

The fourth year of the program, 2021, focuses on residential roads. The main treatments suggested for this part of the program are crack sealing, slurry sealing, patch work, rotomilling with 2 or 3 inch overlays, base repair and overlay, and full depth reclamation. The estimated cost of road maintenance work for 2021 is \$2,089,486. The recommended funding distribution for the three pavement preservation strategies is given in Table 12.

Treatment Category	Funding
Routine/Preventative	\$ 1,003,047.27
Rehabilitation	\$ 70,140.00
Reconstruction	\$ 1,016,298.77
<b>TOTAL</b>	<b>\$ 2,089,486.04</b>

**Table 12. Paved Road Funding Distribution for 2021**

The fifth and final year of the program, 2022, focuses on residential roads. The main treatments suggested for this part of the program are crack sealing, slurry sealing, patch work, rotomilling with a 3 inch overlay, and base repair and overlay. The estimated cost of road maintenance work for 2022 is \$1,752,716. The recommended funding distribution for the three pavement preservation strategies is given in Table 13.

Treatment Category	Funding
Routine/Preventative	\$ 815,221.43
Rehabilitation	\$ -
Reconstruction	\$ 937,494.75
<b>TOTAL</b>	<b>\$ 1,752,716.18</b>

**Table 13. Paved Road Funding Distribution for 2022**

The list of streets within the road network that are recommended to be treated each year of the five-year maintenance plan can be found in Appendix G. The resulting RSL values for the road network in 2022 after the treatment plan has been completed can be found in Figure 13.

## **Implementation of Pavement Management System**

A fully implemented pavement management system can be a useful tool to a city, town, or county in cost effectively maintaining their street or road networks at a high service level.

A majority of the work necessary to implement a pavement management system has been done by the Utah LTAP Center. As described in this report, a full inventory and condition survey of Bountiful's street network has been made. This provided the basis for the analysis of the street network's current conditions. In addition, a pavement preservation program and recommendations have been made that will enable Bountiful to maintain and enhance the service life of its street network.

The following steps are suggested to facilitate the implementation of the pavement management system and assure its beneficial use:

1. Conduct briefings with appropriate personnel to explain the details and procedures of the pavement management system.
2. Train the appropriate personnel on how to implement the recommended pavement preservation program.
3. Develop a pavement structure history database including dates of initial construction and subsequent maintenance and rehabilitation actions.
4. Develop a traffic database and incorporate traffic counts, classifications, and axle load data.
5. In cooperation with the personnel responsible for the maintenance of the street network, conduct site reviews of street segments recommended for treatment.

The Utah LTAP Center is available and can assist in this implementation effort. Further fieldwork and support is available on an as needed actual cost basis. This can be arranged and scheduled by contacting Nick Jones at the Utah LTAP Center.

## **Importance of Feedback**

The pavement management system set forth in this report is systematic in nature. Therefore, special steps and efforts should be taken to assure that everyone involved has an opportunity and a means to provide both input and feedback in the pavement management process. As shown in Figure 1 of the introduction to this report, feedback among all elements of the pavement management process is essential for the system to be dynamic and useful to the city. Effective feedback has been accomplished by several agencies by establishing a pavement management team or group. This team is comprised of representatives from each operating element involved in the process within the organization. Typically, this team is led by someone from the Public Works Department who assigns specific duties to each team member commensurate with their role in the pavement management process.

The pavement preservation program requires accurate and timely feedback on all decisions and actions taken with respect to preservation (routine maintenance, preventative maintenance, rehabilitation maintenance, and reconstruction) of each street segment. This feedback should include such information as type of work performed, unit costs of work items, amount and quality of work performed, date of completed work, additional pavement structure added, and any other design related information. In addition, periodic condition surveys should be made to keep track of the condition of each street and the network as a whole. These periodic condition surveys should be conducted every two to three years.

## Summary of Findings and Recommendations

### Findings

Currently the streets network classifications in Bountiful are: 62.4% of the street network is classified as residential, 14.2% as minor collector, 21.9% as major collector, and 1.5% as minor arterial.

Analyses of the distress information of the paved street network showed that there were six distress types prevalent in the asphalt paved streets network and six in the concrete paved streets network. Of these distress types, fatigue cracking occurred most frequently in the asphalt streets network and spalling of joints occurred most frequently in the concrete streets network. The percent areas of the asphalt and concrete street networks affected by these distress types were previously shown in Figure 6 and Figure 7.

Currently, the average remaining service life (RSL) for Bountiful's entire asphalt paved street network is estimated to be 10.10 years and 13.6 years for the concrete street network. The current percent of street network surface area with no service life left (terminal serviceability or RSL = 0) is 0.0%.

### Comparison of Surveys

The Bountiful City Public Works department performed an in-house survey. The difference in beginning and ending addresses for each street segment caused some differences between the in-house survey performed by Bountiful City Public Works and the survey performed by the engineering technicians at Utah LTAP. However, a comparison between the two plans shows similar results for both surveys. Some of the rating comparisons between the in-house survey and LTAP survey are as follows: a rating of 9 compares with an RSL 20, a rating of 5 compares with an RSL 8 or 10, and a rating of 1 or 2 compares with an RSL 0 or 2. The treatments associated with each rating are similar for both surveys. The main difference between the surveys is the specific distress information included in the survey performed by Utah LTAP. This data can help with recognizing what distresses are found in a segment to know what the best treatments are for the given segment. Overall, the results of the Utah LTAP survey support the results found in the in-house survey from Bountiful City Public Works.

## Recommendations

Using the pavement preservation program presented in this report, the estimated average RSL of Bountiful’s streets network can be increased to approximately 11.52 years by the year 2022. The percent of street network surface area at the terminal serviceability level will be approximately 2.85%. In addition, the RSL distribution of the street network in terms of RSL distribution categories is improved. With the improved RSL distribution, the most cost-effective strategies and treatments can be used to maintain the street network. Bountiful’s street network is currently in a “good” condition.

A 5-year maintenance plan is recommended for preserving the asphalt street networks at a high level of service. Costs of expanding the network are not included in the given recommended budget. Future funding needs will likely increase due to inflation, increased pavement surface areas, increased traffic volumes, and increased material costs. All Road Funds should be allocated to pavement preservation. Additional funds required for personnel, capital improvements, and capacity improvements should come from other funding sources such as impact fees and mill levies. The details of this recommended pavement preservation program are given in Appendix G.

It has been a pleasure working with Bountiful City to provide the information included in this report. Bountiful’s Public Works and Engineering Department have been extremely supportive of the work that has been done in preparing the pavement preservation program. The pavement management program can be used to maintain and improve the streets network for several years to come.

## **Appendix B**

### **Condition Survey Evaluation Sheet**

### FATIGUE CRACKING

Severity

Severity	Extent		
	Low	Medium	High
<b>0</b> None	1 Crack WP or 1' off C&G Length	2 Crack WP or 1'-2' off C&G Length	>30% of Surface Area or Length
<b>Low</b> Cracks < 1/4"	1	2	3
<b>Medium</b> Cracks 1/4" to 3/4"	4	5	6
<b>High</b> Cracks > 3/4"	7	8	9

### BLOCK CRACKING

Severity

Severity	Extent		
	Low	Medium	High
<b>0</b> None	> 15x15' Squares	15'-10'x Squares	< 10'x10' Squares
<b>Low</b> Cracks < 1/4"	1	2	3
<b>Medium</b> Cracks 1/4" to 3/4"	4	5	6
<b>High</b> Cracks > 3/4"	7	8	9

### LONGITUDINAL CRACKING

Severity

Severity	Extent		
	Low	Medium	High
<b>0</b> None	1 Crack Full Length	2 Cracks Full Length	> 2 Cracks Full Length
<b>Low</b> Cracks < 1/4"	1	2	3
<b>Medium</b> Cracks 1/4" to 3/4"	4	5	6
<b>High</b> Cracks > 3/4"	7	8	9

### UTILITY CUTS

Severity

Severity	Extent		
	Low	Medium	High
<b>0</b> None	0-10% of Length	10-30% of Length	>30% of Length
<b>Low</b> Cracks < 1/4"	1	2	3
<b>Medium</b> Cracks 1/4" to 3/4"	4	5	6
<b>High</b> Cracks > 3/4"	7	8	9

Note: to rate potholes use the same form with the following changes to the severity: **Low** is <1" deep, **Med** is 1"-2" deep and **High** is >2"

### TRANSVERSE CRACKING

Severity

Severity	Extent		
	Low	Medium	High
<b>0</b> None	> 100' between Cracks	100'-20' between Cracks	< 20' between Cracks
<b>Low</b> Cracks < 1/4"	1	2	3
<b>Medium</b> Cracks 1/4" to 3/4"	4	5	6
<b>High</b> Cracks > 3/4"	7	8	9

### EDGE CRACKING

Severity

Severity	Extent		
	Low	Medium	High
<b>0</b> None	0-10% of Length	10-30% of Length	> 30% of Length
<b>Low</b> 0-6" from Curb	1	2	3
<b>Medium</b> 6-18" from Curb	4	5	6
<b>High</b> 18" from Curb	7	8	9

### Rutting

Excellent 0	Low <3/8"	Med 1/2"-3/4"	High >3/4"
----------------	--------------	------------------	---------------

# CONCRETE RATING SHEET

## SPALLING OF JOINTS

		<u>Extent</u> (Number of joints)		
		Low	Medium	High
<b>Severity</b>	<b>0</b> None	0-10%	10-22%	>22%
	<b>Low</b> spalls < 3" wide	1	2	3
	<b>Medium</b> spalls 3" to 6" wide	4	5	6
	<b>High</b> spalls > 6" wide	7	8	9

## JOINT SEAL DAMAGE

		<u>Extent</u> (Number of joints)		
		Low	Medium	High
<b>Severity</b>	<b>0</b> None	0-10%	10-22%	>22%
	<b>Low</b> damage <10% of joint length	1	2	3
	<b>Medium</b> damage 10% to 50% of joint length	4	5	6
	<b>High</b> damage >50% of joint length	7	8	9

## CORNER BREAKS

		<u>Extent</u> (Percent of slabs with corner breaks)		
		Low	Medium	High
<b>Severity</b>	<b>0</b> None	<10%	10-20%	>20%
	<b>Low</b> Diagonal corner cracks in slab, no spalling/faulting	1	2	3
	<b>Medium</b> Corner Crack is slightly spalled & faulted <1/4"	4	5	6
	<b>High</b> Corner Breaks is highly spalled and faulted >1/4"	7	8	9

### BROKEN SLABS

	<u>Extent (Number of slabs)</u>			
	Low	Medium	High	
<b>0</b> None	<6%	6-15%	>15%	
<b>S</b> <b>e</b> <b>v</b> <b>e</b> <b>r</b> <b>i</b> <b>t</b> <b>y</b>	<b>Low</b> Slab cracked into more than 3 pieces, no spalling/faulting	1	2	3
	<b>Medium</b> Slab cracked into more than 3 pieces, some spalling, faulting <1/4"	4	5	6
	<b>High</b> Slab broken into 4 or more pieces, spalling/faulting >1/4"	7	8	9

### FAULTING

	<u>Extent (Percent length of roadway)</u>			
	Low	Medium	High	
<b>0</b> None	<10%	10-30%	>30%	
<b>S</b> <b>e</b> <b>v</b> <b>e</b> <b>r</b> <b>i</b> <b>t</b> <b>y</b>	<b>Low</b> <1/2"	1	2	3
	<b>Medium</b> 1/2" to 1"	4	5	6
	<b>High</b> >1"	7	8	9

### LONGITUDINAL

	<u>Extent (Percent of slabs with longitudinal cracks)</u>			
	Low	Medium	High	
<b>0</b> None	<10%	10-20%	>20%	
<b>S</b> <b>e</b> <b>v</b> <b>e</b> <b>r</b> <b>i</b> <b>t</b> <b>y</b>	<b>Low</b> crack width <1/8", no spalling/faulting	1	2	3
	<b>Medium</b> crack width 1/8" to 1/2", spalling <3", faulting >1/2"	4	5	6
	<b>High</b> crack width >1/2", spalling >3", faulting >1/2"	7	8	9

**TRANSVERSE**

**Extent (Percent of slabs with transverse cracks)**

**Low Medium High**

<b>S e v e r i t y</b>	<b>0</b> None	<10%	10-20%	>20%
	<b>Low</b> crack width <1/8", no spalling/faulting	1	2	3
	<b>Medium</b> crack width 1/8" to 1/2", spall <3", fault >1/4"	4	5	6
	<b>High</b> crack width >1/2", spall >3", fault >1/4"	7	8	9

**PATCH DETERIORATION**

**Extent (Percent of surface area)**

**Low Medium High**

<b>S e v e r i t y</b>	<b>0</b> None	<10%	10-30%	>30%
	<b>Low</b> no fault, no settle at perimeter	1	2	3
	<b>Medium</b> fault & settle <1/4" at perimeter	4	5	6
	<b>High</b> fault & settle >1/4" at perimeter, cracked/broken patch	7	8	9

**MAP CRACKING**

**Extent (Percent of surface area)**

**Low Medium High**

<b>S e v e r i t y</b>	<b>0</b> None	<10%	10-20%	>20%
	<b>Low</b> small connected cracks, no spalling	1	2	3
	<b>Medium</b> connected cracks, no spalling	4	5	6
	<b>High</b> large connected cracks with surface spalling	7	8	9

## **Appendix F**

### **Preservation Strategies, Treatments, and Associated Costs**

Treatment Type	Maint. Category	Cost	0	1-3	4-6	9-Jul	10-12	13-15	16-18	19-21
Crack Seal	Routine	\$0.45	0	0	0	0	1	2	3	2
Cold Patch	Routine	\$0.45	0	0	0	0	0	0	0	0
Digout and Hot Patch	Routine	\$0.68	0	0	0	0	0	0	0	0
High Perf. Cold Patch	Routine	\$0.90	0	0	0	0	0	0	0	0
Fog Coat	Routine	\$0.68	0	0	0	1	1	2	2	2
High Mineral Asphalt Emulsion	Preventative	\$1.68	0	0	0	1	2	3	5	5
Sand Seal	Preventative	\$0.98	0	0	0	1	2	2	2	2
Scrub Seal	Preventative	\$1.50	0	1	3	5	5	5	5	5
Single Chip Seal	Preventative	\$1.95	0	1	3	5	5	5	5	5
Slurry Seal	Preventative	\$1.06	0	1	3	5	5	5	5	5
Microsurfacing	Preventative	\$3.60	0	2	3	5	7	7	7	7
Plant Mix Seal	Rehabilitation	\$8.40	0	3	4	5	7	7	7	7
Cold In-place Recycling (2 in with chip seal)	Rehabilitation	\$7.50	0	3	4	5	6	7	7	7
Thin Hot Mix Overlay (<2 in)	Rehabilitation	\$10.13	0	4	6	7	7	7	7	7
HMA (leveling) & Overlay (<2 in.)	Rehabilitation	\$11.25	0	4	6	8	8	8	8	8
Hot Surface Recycling	Rehabilitation	\$7.50	0	3	5	7	8	8	8	8
Rotomill & Overlay (<2 in)	Rehabilitation	\$12.60	0	4	7	8	8	8	8	8
Cold In-place Recycling (2/2 in.)	Reconstruction	\$15.45	15	15	15	15	15	15	15	15
Thick Overlay (3 in.)	Reconstruction	\$15.00	12	12	12	12	12	12	12	12
Rotomill & Thick Overlay (3 in.)	Reconstruction	\$16.50	12	12	12	12	12	12	12	12
Base Repair\Pavement Replacement	Reconstruction	\$18.00	16	16	16	16	16	16	16	16
Cold Recycling & Overlay (3/3 in.)	Reconstruction	\$16.73	14	14	14	14	14	14	14	14
Full Depth Reclamation& Overlay (3/3 in.)	Reconstruction	\$19.88	20	20	20	20	20	20	20	20
Base/Pavement Replacement (3/3/6 in.)	Reconstruction	\$28.50	20	20	20	20	20	20	20	20

**\*Fit the current RSL into a category along the top row and then move downward to the applied treatment to find the additional RSL that will be achieved from the selected treatment.**

(2/2 in.) Means 2" overlay with 2" recycle

(3/3/6) Means 3" HMA over 3" Road Base over 6" Base

Costs are per square yard
